ABSTRACT
Reproductive parameters of male and female are found to be altered by many plant extracts. Evaluation of such herbs has been in progress worldwide for several decades to identify effective and safe substances for regulation fertility. This approach proved to be a good alternative to synthetic drugs as the chemicals of plant origin have limited side effects. Various medicinal plants extracts were investigated for their antifertility and fertility activity both in male and female animal models. This review presents update information gathered on scientifically screened medicinal plants used for enhancing fertility as well as antifertility activity. This review provides the information on botanical name along with their common name, ethnic use, parts used, and their importance in regulating reproductive activity on target organ like testis, ovary, uterus and on pregnancy.

Key words: Plant extract, mammals, reproduction, fertility, anti-fertility.

INTRODUCTION
Infertility is one of the major reproductive health issues; which is mainly due to male factors which interfere with the process of spermatogenesis and reduce sperm quality and quantity. Environmental pollutants and some diseases such as coronary heart diseases, diabetes mellitus, chronic liver diseases, chronic smoking, and insufficient vitamins intake have been reported to cause deleterious effects on spermatogenesis.

Considering the sensitivity of reproduction system, it is being easily affected by mentioned factors. In world about 15% of couples are affected by infertility among these 40 to 50% are because of male factors. Existence of natural and sufficient spermatozoids in sperm is necessary for fertility, inability to produce sperm and ejaculation, premature ejaculation causes infertility.

On the other hand fertility control is again another issue of global and national public health concern. Current methods of contraception result in failure with an unacceptable rate of unintended pregnancies having many side effects. Besides these chemicals use of anti-fertility agent is one of the methods in controlling human population.

India has vast resources of natural products people have been using many of the medicinal plants for inducing abortion and permanent sterility. A large number of herbal drugs are used to control fertilization with considerable success, numerous plants have been reportedly used historically by women to aid child delivery, stimulate menstrual flow or reduce fertility. Modern scientific studies in experimental animals have confirmed the effect of some of these herbs on the reproductive system without producing apparent toxic effects.

MATERIAL AND METHODS
A brief survey has been done to gather information of plants related to reproductive health issues. Plants extracts which are found to effect reproductive system of mammalian models in various experiments are taken into account.
In this review the effect of plant extracts on the reproductive parameters such as spermatogenesis, activity of germinal and leydig cells, sperm motility, sperm concentration, survivability, weight of sex organs and accessory organs in male whereas in female weight of ovaries, serum level of FSH, LH, estrous cycle, ovulation have been compiled together. Based on the positive and negative effect the extract posses on the parameters, plants are grouped under two broad sections: (I) Plant extracts inducing fertility and (II) Plants having antifertility effects.

RESULTS AND DISCUSSION

(I) Plant extracts inducing fertility

1. Aloe vera:
Aloe is a cactus-like perennial herbaceous plant of Asphodeloideae family which grows easily in arid warm regions of Africa, North America, Europe, and Asia and generally can be sown as pot plant in houses. This plant contains many vitamins including antioxidant vitamins like A and C, vitamins of B group like thiamin, niacin, B2 (Riboflavin), B12, and folic acid and elements like Sodium, potassium, calcium, magnesium, manganese, copper, chrome, and iron are also present. In an experiment, a mature male mouse was treated with 0.5cc of extract with 50, 100, and 200 mg/kg doses every other day for twenty days. It seems that compounds in Aloe vera extract doesn't affect Pituitary-hypothalamus-testis axis and affects spermatogenesis in mice directly via stimulating activity of germinal cells and also indirectly via stimulating leydig cells and increasing testosterone hormone.

2. Zingiber officinale:
The active ingredients of ginger (Zingiber officinale L., Family Zingiberaceae) roots and leaves such as zingerone, gingerdiol, zingibrene, gingerols and shogaols produced antioxidant activity. The natural antioxidants can protect DNA and other molecules from cell damage induced by oxidation and can improve sperm quality and increase reproductive efficiency of men. Oral administration of ginger extract at 250 and 500 mg/kg for 65 days to male diabetic rats caused increases in the weight of testes and seminal vesicle, a decrease in blood glucose associated with increases in serum insulin. As a result an improvement of sperm motility and quantity as well as alleviation in testicular degenerative changes was seen in the testis of diabetic rats.

3. Cynoglossum zeylanicum:
Cynoglossum zeylanicum of family Lauraceae is commonly known as cinnamon. Bark of cinnamon is used in Arabian countries as a spice for most foods. In Eastern and Western folk medicine, it used for treating abdominal and chest pains, chronic diarrhea, hypertension, kidney disorders and rheumatism. Cinnamon extracts have also demonstrated hepatoprotective and antioxidant effects in CCL4 (Carbon tetrachloride) - intoxicated rats. With regard to cinnamon extract, data revealed that its oral administration at the large dose, 500 mg/kg body weight decreased blood glucose level associated with increases in serum insulin and testosterone levels and an improvement of sperm motility and quantity as well as alleviation of testicular degenerative changes were observed in the testis of diabetic rats.

4. Tribulus terrestris:
The plant Tribulus terrestris of family Zygophyllaceae, has been long time known in native medicine of eastern countries and Bulgaria. It has been used in the treatment of sexual deficiencies. This plant contains biologically rich compounds as steroids, saponins, flavonoids, alkaloids and unsaturated acids, which are involved in promoting numerous physiological responses. The most considerable effect of Tribulus terrestris extract is observed on sperm concentration and survivability of rams when administrated with 1.5g daily for 40 days. Survivability of sperms at 37°C in treated rams is significantly higher than in control group by 73 % and the viability of spermatozoids in experimental rams was very long, more than 24 hours. Count of spermatozoids was found to be enhanced by 31%.

5. Xylopia aethiopica:
Xylopia aethiopica, an angiosperm of the Annonaceae family is a tropical evergreen tree growing up to 20 metres bearing aromatic seeds. Fruit decoction of X. aethiopica is used to treat bronchitis, asthma, infertility, arthritis and rheumatism and as postpartum tonic. The finding indicates that ethanolic extract of X. aethiopica causes increase in animal body weight as well as weights of sexual organs such as testis.
and epididymis dose-dependently. Ethanolic fruits extract of X. aethiopica was administered orally to groups of male Sprague Dawley rats at the doses of 30, 100 and 300 mg/kg for 60 days. The number of sperms in epididymis was also markedly increased. The increased sperm counts as well as increased weight of sexual organs are indicative of improved fertility because of extract treatment. In conclusion, ethanolic extract of X. aethiopica increased steroid hormones as well as sperm count, the mechanism of which appears to be through stimulation of gonadotropin probably by hypothalamus activation\textsuperscript{22}.  

6. Moringa oleifera Seed:  
Moringa oleifera (Linn) is a medicinally important plant, belonging to family Moringaceae. The plant is also well recognized in India, Pakistan, Bangladesh and Afghanistan as a folkloric medicine\textsuperscript{23}. The aqueous extract of M. oleifera seed at doses of 100, 200 and 500 mg/kg were administrated for 21 days. The effect of the extract on body weight, reproductive and vital organ weight were determined. Oral administration of aqueous extract at doses of 100, 200 and 500 mg/kg significantly increased the libido and sperm count in experimental animal. The extract was also observed to be devoid of any adverse effects and acute toxicity. Thus, aqueous extract of M. oleifera seed was found to enhance sexual behaviour in male rats\textsuperscript{24}.

(II) Plant extracts having antifertility effects:  

1. Achillea millefolium:  
Achillea millefolium is a plant known as Yarrow, belonging to the Asteraceae family, native to Europe, North America, Southern Australia and Asia\textsuperscript{25,26}. Achilea ellefolium flowers in particular with high dose, cause a significant decrease in fertility parameters in male rats. Oral administration of alcoholic extract of Achillea millefolium 200 and 400 mg/kg, for 55 days, in male rats, was found to reduce the hormone level of testosterone. The extract was also found to alter androgen hormones synthesis of Leydig cells\textsuperscript{27}.  

2. Cynodon dactylon Pers:  
Cynodon dactylon Pers (Family: Graminae) is a creeping grass found in warm climates all over the world between 450 south and north altitude. The Cynodon dactylon is available throughout the year, and used by the domestic animals as food and for pooja in all parts of India. The juice of this plant is astringent and is applied externally to fresh cuts and wounds. It is also useful in treatment of catarrhal ophthalmia, dropsy, hysteria, epilepsy, insanity, chronic diarrhea and dysentery\textsuperscript{28}. Effect of aqueous extract of entire plant of Cynodon dactylon extract on reproductive organ weight and estrous cycle in female rats was evaluated. A extract of Cynodon dactylon 400 mg/kg body weight /day, was orally administered for 30 days. A significant increase (P<0.001) in the weight of the uterus and a significant decrease (P<0.001) in the weight of the ovaries was observed in the treated group. Further, the estrous cycle was found to be irregular and disturbed. Findings revealed that the aqueous extract of entire plant of Cynodon dactylon possess antifertility activity\textsuperscript{29}.  

3. Polygala rosmarinifolia:  
Polygala rosmarinifolia of family Polygalaceae, was traditionally used by Americans to treat snake bites\textsuperscript{30} and as an expectorant to treat cough and bronchitis. Anti-fertility effect of ethanol extract of whole plant extract of Polygala rosmarinifolia was observed in male albino rats. The relative weight of the testes and epididymis were decreased. The epididymal sperm count, motility and sperm abnormality were reduced significantly in treated rats. The results of fertility test indicated that the treated adult male rats reduced the number of female’s impregnation on administration of 100 and 200 mg/kg body weight. In addition, the number of implantations and the number of viable fetuses were also decreased\textsuperscript{31}.  

4. Curcuma comosa:  
Estrogens have been reported to occur naturally in a number of plants and can depress fertility in animals on ingestion\textsuperscript{32,33,34}. In Thailand, Curcuma comosa Roxb of family Zingiberaceae, which is widely used for relief of lower abdominal pain in males contains estrogen like activity\textsuperscript{35,36}. Intragastric administration of the C. comosa extract at a dose of 500 mg/kg body weight for 7 consecutive days in mature male Wistar rats, significantly decreased weights of testes, ventral prostate and seminal vesicles. The decreased testicular weight corresponded with a marked regression of spermatogonia and spermatids in the seminiferous tubules. Biochemical analysis revealed significantly decreased activity of acid phosphatase.
in the ventral prostate. The activity of α-glucosidase in the cauda epididymides, and the fructose content in coagulating glands, were not significantly affected. Sperm concentration and motility in the cauda epididymides were also significantly suppressed\(^\text{37}\).

5. Artemisia lanata:
Artemisia lanata, aromatic shrubs belonging to the Asteraceae family, is traditionally used worldwide for its anti-inflammatory, antimicrobial, antifungal, and sedative activities\(^\text{38,39}\). The pregnant rats were treated with vehicle or 200 and 400mg/kg of A. lanata hydroalcoholic extract from 2-8 day of pregnancy. Then, number and weight of neonates, duration of pregnancy, and percent of dead fetuses were determined. A. lanata had no significant effect on duration of pregnancy, average number of neonates, and weight of neonates. However, administration of 200 and 400 mg/kg of the extract led to 30% and 44% abortion in animals, respectively\(^\text{40}\).

6. Momordica charantia:
Methanolic extract of Momordica charantia seeds of family Cucurbitaceae, was administrated orally at dose level of 25 mg/100 g body weight showed irregular pattern of estrous cyclicity and significantly increased in length of the estrous cycle in rats in a reversible manner\(^\text{41}\). Phytochemical analysis of the extract showed the presence of steroids, triterpenoids, reducing sugars, sugars, alkaloids, phenolic compounds, flavonoids and tannins\(^\text{42}\). The disruption of the estrous cycle was possibly because of these phytochemicals on the ovary which controls ovarian functions and estrous cyclicity through interplay of ovarian and extra ovarian hormones\(^\text{41}\).

## CONCLUSION

Plants have been a source of medicine in the past centuries and today scientists and the general public recognize their value as a source of new or complimentary medicinal products. Recently, wide array of research investigations highlight the potential health beneficial principles from phytal sources. Medicinal plants constitute one of the main sources of new pharmaceuticals and health care products. There has been an increase in demand for the phytopharmaceuticals all over the world because of the fact that the...
allopathic drugs have more side effects. This review makes an attempt to compile some of the plants whose extract have been used to enhance fertility and antifertility in mammals. Various phytoconstituents like alkaloids, flavonoids, tannins, xanthones, triterpenes, quinones etc. were involved in regulation of reproductive activity.
