ABSTRACT

India is the largest milk producing country in the world with 155.5 million tones milk production and per capital availability 337gms/day (2015-16). There is scope for expanding and improving the indigenous confections by introducing a variety of products adopting improved methods and technology. Paneer is Heat-acid Coagulated and an important indigenous milk product, which is extensively used as base material or filler in preparation of large number of culinary dishes. Paneer is good source of animal protein to the vegetarian food. Effect of different coagulant i.e Citric acid (2%), Lactic acid (2%), Tartaric acid (2%) and Lemon juice (Fresh as such) on yield and Total solid recovery of paneer prepared using Buffalo and Cow milk. lactic acid and Buffalo milk could be successfully utilized for preparation of paneer and give higher yield (Average 20.86%) and total solid recovery (Average 66.39 %) as compared to using other Coagulant.

Key word: Cow milk, Buffalo milk, Paneer, Coagulant, Statistical analysis

INTRODUCTION

India is the largest milk producing country in the world with 155.5 million tones milk production and per capital availability 337gms/day (2015-16). Pattern of milk utilization in India indicates that about 37.7% of total milk produced in India is converted in various milk products which occupies prominent place in Indian economy.12 Chhana, a heat acid coagulated product of the milk forms the base material for manufacturing Paneer. Pattern of milk production in India indicates that about 6 percent of the milk produced is coagulated to produce chhana12 & Paneer is an important indigenous milk product, which is extensively used as base material or filler in preparation of large number of culinary dishes. Paneer production in India is about 2,35,000 tonnes which amounts to Rs. 18 billion. This indicates that there is tremendous opportunity for manufacture and marketing of paneer. According to PFA act (1976) paneer means the product obtained from cow or buffalo milk or combination thereof by precipitation with sour milk, lactic acid or citric acid.
It shall not contain more than 70 per cent moisture and the milk fat content shall not be less than 50 per cent of the dry matter. *Paneer* is an Indian variety of soft cheese characterized by typical mild acidic flavour with slightly sweet taste, spongy body and close-knit texture. It is a rich source of protein and fat. It contains 53-55% moisture, 23-26% fat, 17-18% protein, 2-2.5% carbohydrates and 1.5 to 2.0% minerals. The quality of *paneer* prepared depends upon the type and quality of milk used, heat treatment of milk, type, strength and amount of coagulant used, coagulation temperature and pH of coagulation.\textsuperscript{11}

*Paneer* is mainly used as base material in the preparation of various culinary dishes like curries of peas, potatoes, spinach etc. *Paneer* snacks are close competitors of those made out of fried fish or chicken in terms of popularity. *Paneer* is good source of animal protein to the vegetarian food. It is an excellent match of non-vegetarian food.

The present study entitled “Effect of different coagulants on yield of *paneer*” was undertaken with following objectives:

1. To standardize the procedure for manufacturing *paneer* by using different coagulants.
2. To find out suitable coagulant for preparation of *paneer*.
3. To find out yield and total solid recovery of *paneer*

**MATERIAL AND METHODS**

**Material:**

**Raw milk:** Bulk raw milk from the herd of crossbred cows and buffalos maintained at dairy unit of College of Agriculture, Dapoli was used for the study.

**Coagulants:** For the coagulation of milk during *paneer* preparations following coagulants were used:

1) Citric acid 2) Lactic acid 3) Tartaric acid 4) Lemon juice

**Equipments and Accessories:** Aluminium and stainless-steel vessels, Karahi. Ladle, Muslin cloth, *Paneer* hoop, Standard weight.

**Methodology**

**Preparation of *Paneer***.

*Paneer* was prepared as per the procedure standardized by Battacharya et al.\textsuperscript{2} The flow diagram of *paneer* manufacturing is given hereunder:

**Flow diagram**

```
Milk
Filtration
Heat to 85°C
Add 2% citric acid(Any Coagulant) in milk at 70°C
Draining of whey
Hooping and pressing
Cutting of curd into pieces
Chilling and brining
Storage of *paneer*
```

**Treatments:**

**Type of milk:** T\textsubscript{1} - Cow milk, T\textsubscript{2} - Buffalo milk

**Type of coagulants** C\textsubscript{1} - Citric acid (2%), C\textsubscript{2} - Lactic acid (2%)

C\textsubscript{3} - Tartaric acid (2%) C\textsubscript{4} - Lemon juice (Fresh as such)

**Treatment combinations**

T\textsubscript{1}C\textsubscript{1} - Cow milk/Citric acid; T\textsubscript{1}C\textsubscript{2} - Cow milk/Lactic acid; T\textsubscript{1}C\textsubscript{3} - Cow milk/Tartaric acid; T\textsubscript{1}C\textsubscript{4} - Cow milk/Lemon juice; T\textsubscript{2}C\textsubscript{1} - Buffalo milk/Citric acid; T\textsubscript{2}C\textsubscript{2} - Buffalo milk/Lactic acid; T\textsubscript{2}C\textsubscript{3} - Buffalo milk/Tartaric acid; T\textsubscript{2}C\textsubscript{4} - Buffalo milk/Lemon juice

**Replications:** The trial was conducted with six replications.

**Yield of *Paneer***: Yield of *paneer* at each treatment was recorded and percent recovery was calculated.

**Statistical Design and Analysis:** The statistical design adopted to study the different aspects was Factorial Randomized Block Design with six replications and eight treatment combinations. The statistical
analysis was carried out according to Snedecor and Cochran.

RESULTS AND DISCUSSION
The results of present research work are average of six time replicated data tabulated, presented and discussed along with Statistical analysis under following main heads.

**Total solids recovery:**
Data patinent to total solids recovery in paneer prepared from types of milk by using different coagulants are presented in Table 1 and illustrated in Fig. 1.

### Table 1: Total solids recovery of paneer (per cent)

** Significant at 5%

The per cent recovery of milk solids in buffalo milk paneer was higher than that of cow milk i.e. 61.51 and 59.87 per cent, respectively (Table 1).

De and Ray reported that per cent recovery of milk solids as 65 and 68 per cent in chhana from cow and buffalo milk, respectively. Joshi also observed same trend in respect of recovery of milk solids. He reported 61.53 and 71.66 per cent recovery in chhana from cow and buffalo milk, respectively. Higher recovery of milk solids in buffalo milk chhana may be due to higher fat level in buffalo milk as suggested by De and Ray and Kundu and De.

Total solids recovery values showed similar trends as exhibited by total solids content. The results thus indicate that coagulants did not have any noticeable effect on recovery of milk solids in paneer. The findings are in agreements with those of Bhattacharya et al. who reported that buffalo milk paneer contained significantly higher total solids and showed higher recovery of total solids in paneer as compared to cow milk paneer.

The various types of coagulant significantly influenced the total solids recovery of paneer. The treatments C2, C1 and C4 produced significantly higher total solids recovery in paneer than treatment C3 i.e. 65.04, 61.04, 59.71 and 56.98 per cent, respectively. Sachdeva and singh reported that lactic acid resulted in higher total solids recovery in paneer (65.67 per cent) than citric acid (62.31 per cent) and tartaric acid (62.22 per cent).

### Yield of paneer:
The yield of paneer mainly depends upon the type of milk used, heat treatment, coagulant and its concentration and other aspects which are known to vary to a great extent. According to Rao et al., higher yield (20.35%) of paneer can be obtained from milk heated to 85º c and coagulated at 70º c.

The results given in Table 2 and Fig. 2 shows the yield of paneer prepared from cow and buffalo milk with different types of coagulant.

** Significant at 5%
The yield of paneer from buffalo milk (19.61 per cent) was significantly higher than the yield produced from cow milk (17.18 per cent), respectively.

The results of present investigation are in close agreement with the values reported by Pal et al.\textsuperscript{9}, Singh and Kanawjia\textsuperscript{15} who reported 21.00 ± 1.59 per cent and 22.0 per cent yield of paneer prepared from buffalo milk, respectively. Singh and Kanawjia\textsuperscript{14} reported 17.4 per cent yield of paneer prepared from cow milk. Syed reported that average yields of paneer were 14.14, 18.24 and 9.85 per cent when made from cow milk (4.5% fat and 8.5% SNF), buffalo milk (6% fat and 9.5% SNF) and cow skim milk (0.10% fat), respectively.

In general, the yield decreases with increase in the strength of coagulant, coagulation temperature and lowering the pH of coagulation in case of buffalo milk\textsuperscript{14} and it increases with increase in the coagulation temperature in cow milk paneer\textsuperscript{14}.

The yield of paneer depends mainly on the total solids content of milk and amount of moisture retained in paneer\textsuperscript{4}. According to Chandan the yield of paneer is dependent on the fat and solids not fat content of the starting milk, as well on the moisture, fat and protein retained in the paneer.

In the present investigation higher yield of paneer obtained from buffalo milk may be attributed to the high total solids content in the milk. The perusal of Table 1 reveals that the milk solids recovery was also higher in buffalo milk paneer (61.51 per cent) as compared to cow milk paneer (59.87 per cent).

Yield of paneer varied significantly due to coagulants. Significant variation in the yield of paneer prepared with citric acid, lactic acid, tartaric acid and lemon juice may be the result of significant variation in total solids recovery in the product (Table 1). The yield of paneer at treatment C1, C2, C3 and C4 were 18.32, 19.39, 17.85 and 18.03 per cent, respectively. Sachdeva and Singh\textsuperscript{14} observed 21.80, 21.67 and 22.58 per cent yield of paneer for coagulants viz citric acid, tartaric acid and lactic acid, respectively.

The interaction between types of milk and coagulants showed significant differences for their influences on yield of paneer. This indicates that the variation in yield of paneer due to types of milk was different at different types of coagulant.
CONCLUSION

From the result of present investigation it may be concluded that lactic acid and Buffalo milk could be successfully utilized for preparation of paneer and give higher yield and total solid recovery as compared to using other Coagulant.
