### ABSTRACT

The reniform nematodes of the genus *Rotylenchulus* (Haplolaimidae: Nematoda) are sedentary semi-endoparasites of numerous crops. There are ten species out of which *R. reniformis* and *R. parvus* are important, and three species (*R. amanictus*, *R. clavicadatus*, *R. leptus*) are monophagous: two on monocots and one on Rosids. In general, *Rotylenchulus* species are capable of feeding from very primitive Magnoliids to plants of advanced category. Preference was distinctly observed towards the plants in Rosids (42.779%) followed by monocots (23.949%) and Asterids (21.755%). The SAI values were also higher for these groups of plants. The study on lineages further revealed intimate affinity to febrids (25.594%), followed by commelinids (18.647%), malvids (16.088%), lamiiids (11.883%), and campanulids (9.141%). Poales contribution within commelinids was 65.353%. Maximum affinity of *Rotylenchulus* species was observed by their association with plants from families Poaceae (7), followed by Fabaceae (6), Malvaceae (6), Asteraceae (4), Oleaceae (4), Soanaceae (4) and so on.

**Key words:** Agiosperms, Gymnosperms, APG IV system, Reniform nematodes, Monocots, Rosids, Asterids

### INTRODUCTION

Plant parasitic nematodes pose a great constraint on food and fruit production throughout the world. Damage caused by plant nematodes has been estimated at US \$ 80 billion per year<sup>11</sup>. The reniform nematodes of the genus *Rotylenchulus* (Haplolaimidae : Nematoda) are sedentary semi- endo-parasites of numerous herbaceous and woody plants<sup>17</sup>. They are predominantly distributed in tropical and subtropical climates. Out of ten species of *Rotylenchulus*, *R. reniformis* and *R. parvus* are important and pose significant threat to large

number of crops, whereas the other eight species are of limited importance. It has been observed that nematodes, in general, parasitize hosts from selected group of plants as observed by Rathore and Ali<sup>13</sup> in *Meloidogyne incognita*, Rathore and Tiwari<sup>14</sup> in root-knot nematodes, Rathore and Tiwari<sup>15</sup> in *Aphelenchoides* species, and Rathore<sup>12</sup> *Xiphinema americanum*. It was, therefore, obvious to study the host preference of *Rotylenchulus* species in relation to various host plants and particularly to their affinity to taxonomic group(s) of plants.

**Cite this article:** Rathore, Y.S., Host Choice in *Rotylenchulus* Species, *Int. J. Pure App. Biosci.* 6(5): 346-354 (2018). doi: <http://dx.doi.org/10.18782/2320-7051.6878>

## MATERIAL AND METHODS

Host plants of different species of *Rotylenchulus* reported by Nemaplex<sup>10</sup> and Marias and Swart<sup>9</sup> were downloaded and arranged according to the APG IV<sup>1</sup> system of classification of angiosperms which is based on molecular and morphological studies of plants. The families and orders thus reported in the literature were changed to as mentioned by the Wikipedia<sup>18</sup> for different plants. This resulted in placing of certain plants to new families and also placing existing families to new families/orders. Readers, therefore, may not find the same names of families and orders as reported earlier in the literature. APG IV system is delineated to several clades. But broadly speaking, angiosperms divided into monocots and eudicots (dicotyledons) clades and Eudicots into basal and core Eudicots. The classification is still in the developing stage and many families yet to find suitable place. These uncertain families/ orders have been tentatively placed in COM clade. The affiliation of host plants was decided on the basis of number of hosts parasitized as well as by computing the Affiliation Indices following the method of Rathore and Tiwari<sup>14</sup>. General Affiliation Index (GAI) was calculated for different *Rotylenchulus* species and Specific Affiliation Index (SAI) for taxonomic groups of plant species. Some ratios viz., species:genus, species:family and species:order were also calculated to support the host affinity. The terms mono-, oligo-, and polypagous were adopted as defined by Berneys and Chapman<sup>3</sup>.

## RESULTS AND DISCUSSION

Results are reported in Table 1 through 4. Perusal of Table 1 revealed that *Rotylenchulus* species, in general, are capable of parasitizing on all kinds of plants from very primitive Magnoliids to plants of developed category. However, preference was distinctly observed towards the plants of certain groups like monocots, Rosids and Asterids. Rosids contributed 42.779% plants followed by monocots (23.949%) and Asterids (21.755%). The SAI values were also higher for these groups of plants viz., 1.242, 1.064, and 0.823 for Rosids, monocots and Asterids,

respectively and supported the preference based on percent host plants in each taxonomic group. Contribution of Superasterids (4.570%) and COM clade (4.388%) in host range is worth mentioning and both of them got high SAI values because more host plants got grouped comparatively in less number of families and orders. Gymnosperms were also accepted as preferred hosts by some *Rotylenchulus* species (Table 1).

When the preference to taxonomic groups was evaluated on the basis of ratios of host species to their genera, families and orders, the highest ratios were observed in monocots, Rosids and Asterids indicating closeness of food plants with their genera, families and orders.. The same was also visualized in case of Superasterids and COM clade plants where host species utilized less number of families and orders and ultimately showed greater intimacy although had less number of host plants (Table 1).

Association of host plants in three major taxonomic clades was further evaluated by placing number of plants to different lineage groups (Table 2). Febid group contributed 25.594% host plants followed by malvids (16.088%). In Asterids, 11.883 and 9.141% plants were parasitized in lamiids and campanulids, respectively. However, in monocots, the commelinids showed maximum affinity having 18.647% plants and within commelinids, the Poales contribution was to the tune of 65.353%. In spite of large number of plants in the host range, *Rotylenchulus* species preferred plants of certain taxonomic groups.

Information on host range of individual species of *Rotylenchulus* is given in Table 3. Out of ten *Rotylenchulus* species, *R. anamictus*, *R. clavicaudatus* and *R. leptus* showed monophagy and two were monophagous on monocotyledons and one on Rosids. Among the polyphagous species only *R. macrodoratus* and *R. parvus* had moderate number of host plants. The biggest host range was of *R. reniformis* which reported to invade 460 plant species from all taxonomic groups. The GAI values of all the monophagous species was 1.000, whereas in polyphagous species it ranged from 0.500 to 0.737 except in

*R. reniformis* where large number of host species grouped in much less number of genera, families and orders. *R. reniformis* followed the same trend as was depicted for combined description of all the species of *Rotylenchulus*. The major contribution in the host range of *R. reniformis* was of fabids (20.840%) and malvids (14.625%) followed by monocots (commelinids) (15.539%), lamiids (8.592%) and campanulids (7.861%). In addition to that *R. parvus* and *R. reniformis* also hosted on one each gymnosperm plants of family Cupressaceae and Cycadaceae, respectively.

Host plants in some families invited more than one *Rotylenchulus* species. The greater affinity was exhibited by seven *Rotylenchulus* species to host plants in Poaceae, followed by 6 in Fabaceae and Malvaceae and four each in Asteraceae, Oleaceae and Solanaceae (Table 4).

Hutchinson<sup>7</sup> divided dicotyledons in lignosae (trees and shrubs-a fundamentally woody group) and herbaceae (herbs or rarely shrubs-a fundamentally herbaceous group). For discussion, when families of all the host plants of *Rotylenchulus* species were placed in lignosae and herbaceae divisions, it was observed that about 60% of plant species fell in lignosae. This suggests that *Rotylenchulus* species prefer woody plants as their hosts except the ones which are monophagous on monocotyledons.

Gaur *et al.*<sup>6</sup> reported that host range of *R. reniformis* comprise more than 350 plant species including many important crops and weeds that support nematode population in the absence of host crops. Gaur and Perry<sup>5</sup>

observed that *R. reniformis* preferred dicotyledons and results of the present study are in agreement of observations of these authors. Robinson *et al.*<sup>16</sup> expressed his dissent because more dicot plants are present in nature as compared to monocots. It may be more useful if explanation is restricted to our observations i.e. host range of the nematodes in general and/or of any particular species. Similarly, there is a point of disagreement for a reported host plant. It would be better if it retested in the same locality and on the species it was reported earlier as a host. Ecological conditions and host cultivar or variety would undoubtedly play a great role in deciding the acceptability. Variation could also be due to different pathotypes or races prevailing in different ecosystems. Dasgupta and Seshadri<sup>4</sup> reported occurrence of two races (Race-A and Race-B) in India. Arias *et al.*<sup>2</sup> and Leach *et al.*<sup>8</sup> demonstrated genetic variability in *R. reniformis* populations using microsatellite markers suggesting that the pathogenic population of *R. reniformis* could be another species.

Molecular characterization of six valid known species of *Rotylenchulus* viz., *R. clavicaudus*, *R. leptus*, *R. macroratus*, *R. macrosoma*, *R. reniformis* and *R. sacchari* revealed that *R. reniformis* and *R. macrosoma* have sister relationship, but that relationship between other species remain unresolved<sup>17</sup>. In our study, however, *R. macrosoma* had very few host species (only eight), whereas *R. reniformis* 4604. However, all the plant species in the host range of *R. macrosoma* are also present in the host range of *R. reniformis*.

**Table 1. Association of *Rotylenchulus* species with different host parameters**

Taxonomic clade	Host species	Genera	Families	Orders	SAI
Magniliids	8 (1.463)	6 (1.791)	5 (4.000)	5 (5.128)	0.667
Monocots	131(23.949)	89 (26.567)	22 (17.600)	14 (17.949)	1.064

Table 4. Distribution of *Rotylenchulus* species to different families and orders

Host Clade	Host order	Host family	<i>Rotylenchulus</i> species	No. of sp.	
Magnoliids	Laurales	Lauraceae	<i>R. macrodoratus</i> , <i>R. reniformis</i>	2	
		Magnoliales	Annonaceae	<i>R. reniformis</i>	1
	Myristaceae		<i>R. reniformis</i>	1	
	Piperales	Piperaceae	<i>R. reniformis</i>	1	
Monocots	Alismatales	Araceae	<i>R. reniformis</i>	1	
	Arecales	Arecaceae	<i>R. reniformis</i>	1	
		Asparagales	Amaryllidaceae	<i>R. reniformis</i>	1
			Asparagaceae	<i>R. reniformis</i>	1
			Asphodelaceae	<i>R. reniformis</i>	1
	Orchidales	Orchidaceae	<i>R. reniformis</i>	1	
		Commelinales	Commelinaceae	<i>R. reniformis</i>	1
	Dioscoreales	Dioscoreaceae	<i>R. reniformis</i>	1	
Poales	Bromeliaceae	<i>R. reniformis</i>	1		

		Cyperaceae	<i>R. parvus</i> , <i>R. reniformis</i>	2	
		Poaceae	<i>R. borealis</i> , <i>R. brevitubulus</i> , <i>R. leptus</i> , <i>R. macrosoma</i> , <i>R. parvus</i> , <i>R. reniformis</i> , <i>R. sacchari</i>	7	
	Zingiberales	Heleconiaceae	<i>R. reniformis</i>	1	
		Musaceae	<i>R. reniformis</i>	1	
		Strelitziaceae	<i>R. clavicaudatus</i>	1	
		Zingiberaceae	<i>R. reniformis</i>	1	
	Eudicots	Proteales	Proteaceae	<i>R. parvus</i>	1
Ranunculales		Papaveraceae	<i>R. reniformis</i>	1	
Superrosids	Saxifragales	Crassulaceae	<i>R. reniformis</i>	1	
Rosids	Brassicales	Brassicaceae	<i>R. parvus</i> , <i>R. reniformis</i>	2	
		Caricaceae	<i>R. parvus</i> , <i>R. reniformis</i>	2	
		Cleomaceae	<i>R. reniformis</i>	1	
	Cucurbitales	Begoniaceae	<i>R. reniformis</i>	1	
		Cucurbitaceae	<i>R. parvus</i> , <i>R. reniformis</i>	2	
	Fabales	Fabaceae	<i>R. anamictus</i> , <i>R. borealis</i> , <i>R. macrodoratus</i> , <i>R. macrosoma</i> , <i>R. parvus</i> , <i>R. reniformis</i>	6	
	Fagales	Fagaceae	<i>R. macrodoratus</i> , <i>R. reniformis</i>	2	
	Geraniales	Geraniaceae	<i>R. reniformis</i>	1	
	Malvales	Bixaceae	<i>R. reniformis</i>	1	
		Malvaceae	<i>R. borealis</i> , <i>R. brevitubulus</i> , <i>R. macrodoratus</i> , <i>R. reniformis</i> , <i>R. sacchari</i>	5	
	Myrtales	Myrtaceae	<i>R. reniformis</i>	1	
		Onagraceae	<i>R. reniformis</i>	1	
	Rosales	Moraceae	<i>R. macrodoratus</i> , <i>R. reniformis</i>	2	
		Rosaceae	<i>R. macrodoratus</i> , <i>R. parvus</i> , <i>R. reniformis</i>	3	
		Urticaceae	<i>R. macrodoratus</i> , <i>R. reniformis</i>	2	
	Sapindales	Anacardiaceae	<i>R. macrodoratus</i> , <i>R. reniformis</i>	2	
		Rutaceae	<i>R. reniformis</i>	1	
		Sapindaceae	<i>R. reniformis</i>	1	
	Superasterids	Caryophyllales	Aizoaceae	<i>R. reniformis</i>	1
			Amaranthaceae	<i>R. parvus</i> , <i>R. reniformis</i>	2
			Caryophyllaceae	<i>R. macrodoratus</i> , <i>R. reniformis</i>	2
			Mulluginaceae	<i>R. reniformis</i>	1
			Nyctaginaceae	<i>R. parvus</i>	1
Polygonaceae			<i>R. reniformis</i>	1	
Portulacaceae			<i>R. reniformis</i>	1	
Asterids	Apiales	Apiaceae	<i>R. parvus</i> , <i>R. reniformis</i>	2	
		Araliaceae	<i>R. macrodoratus</i> , <i>R. reniformis</i>	2	
		Pittosporaceae	<i>R. parvus</i>	1	
	Asterales	Asteraceae	<i>R. brevitubulus</i> , <i>R. parvus</i> , <i>R. reniformis</i> , <i>R. sacchari</i>	4	
	Ericales	Balsimanaceae	<i>R. reniformis</i>	1	
		Polemoniaceae	<i>R. reniformis</i>	1	
		Sapotaceae	<i>R. reniformis</i>	1	
		Theaceae	<i>R. reniformis</i>	1	
	Gentianales	Apocynaceae	<i>R. macrodoratus</i> , <i>R. parvus</i> , <i>R. reniformis</i>	3	
		Loganiaceae	<i>R. reniformis</i>	1	

		Rubiaceae	<i>R. reniformis</i>	1
	Lamiales	Acanthaceae	<i>R. reniformis</i>	1
		Bignoniaceae	<i>R. reniformis</i>	1
		Lamiaceae	<i>R. macrodoratus, R. parvus, R. reniformis</i>	3
		Oleaceae	<i>R. macrodoratus, R. macrosoma, R. parvus, R. reniformis</i>	4
		Pedaliaceae	<i>R. reniformis</i>	1
		Plantaginaceae	<i>R. reniformis</i>	1
		Scrophulariaceae	<i>R. reniformis</i>	1
		Solanales	Convolvulaceae	<i>R. borealis, R. reniformis</i>
	Solanaceae		<i>R. borealis, R. macrosoma, R. parvus, R. reniformis</i>	4
COM clade	Malpighiales	Euphorbiaceae	<i>R. reniformis</i>	1
		Malpighiaceae	<i>R. reniformis</i>	1
		Passifloraceae	<i>R. reniformis</i>	1
		Violaceae	<i>R. reniformis</i>	1
	Oxalidales	Oxalidaceae	<i>R. reniformis</i>	1
Gymnosperms	Cycadales	Cycadaceae	<i>R. reniformis</i>	1
	Pinales	Cupressaceae	<i>R. parvus</i>	1
